Step 1: Initially, we should create a customized version of the currently running profile. The customized version will disable THP. Find out which profile is active, create a copy. In the following example we currently use the throughput-performance profile:

- tuned profile active
- active tuned profile

```
[root@host]# tuned-adm active
```

```

OS가 가 virtual-guest,
throughput-performance

```

```
Current active profile: throughput-performance // in Server default configuration
```

```
Current active profile: virtual-guest // in Virtual OS
```

가)
/etc/tuned . (

```
[root@host]# mkdir /etc/tuned/cubrid
```

tuned.conf .

```
[root@host]# vi /etc/tuned/cubrid/tuned.conf
```

```
[main]
include= throughput-performance
[vm]
transparent_hugepages=never
```

```
[root@host]# chmod +x /etc/tuned/cubrid/tuned.conf
```

```
[root@host]# tuned-adm profile cubrid
```

- 가

/etc/sysconfig/grub transparent_hugepage=never 가 .

```
GRUB_TIMEOUT=5
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL_OUTPUT="console"

GRUB_DISABLE_RECOVERY="true"
```

```

```

grub2-mkconfig grub.cfg .

```
[root@host]# grub2-mkconfig -o /boot/grub2/grub.cfg
